2. USE CASE DIAGRAM	5
3. ERD	6
4. EERD	7
5. IMPLEMENTATION STEPS	8
6. PROCEDURES/TRIGGERS/VIEWS/FUNCTIONS	9
7. DATABASE DIAGRAM	16
8. T-SQL SCRIPT	17

## OVERVIEW:

The objective of the project is to design database for an online movie management system wherein there are two important entities viz. movies and users. Popular website IMDB is taken as a reference to define most of the entities and relationships. For simplicity, some of the relationships and attributes, are obviously modified.

## SUMMARY:

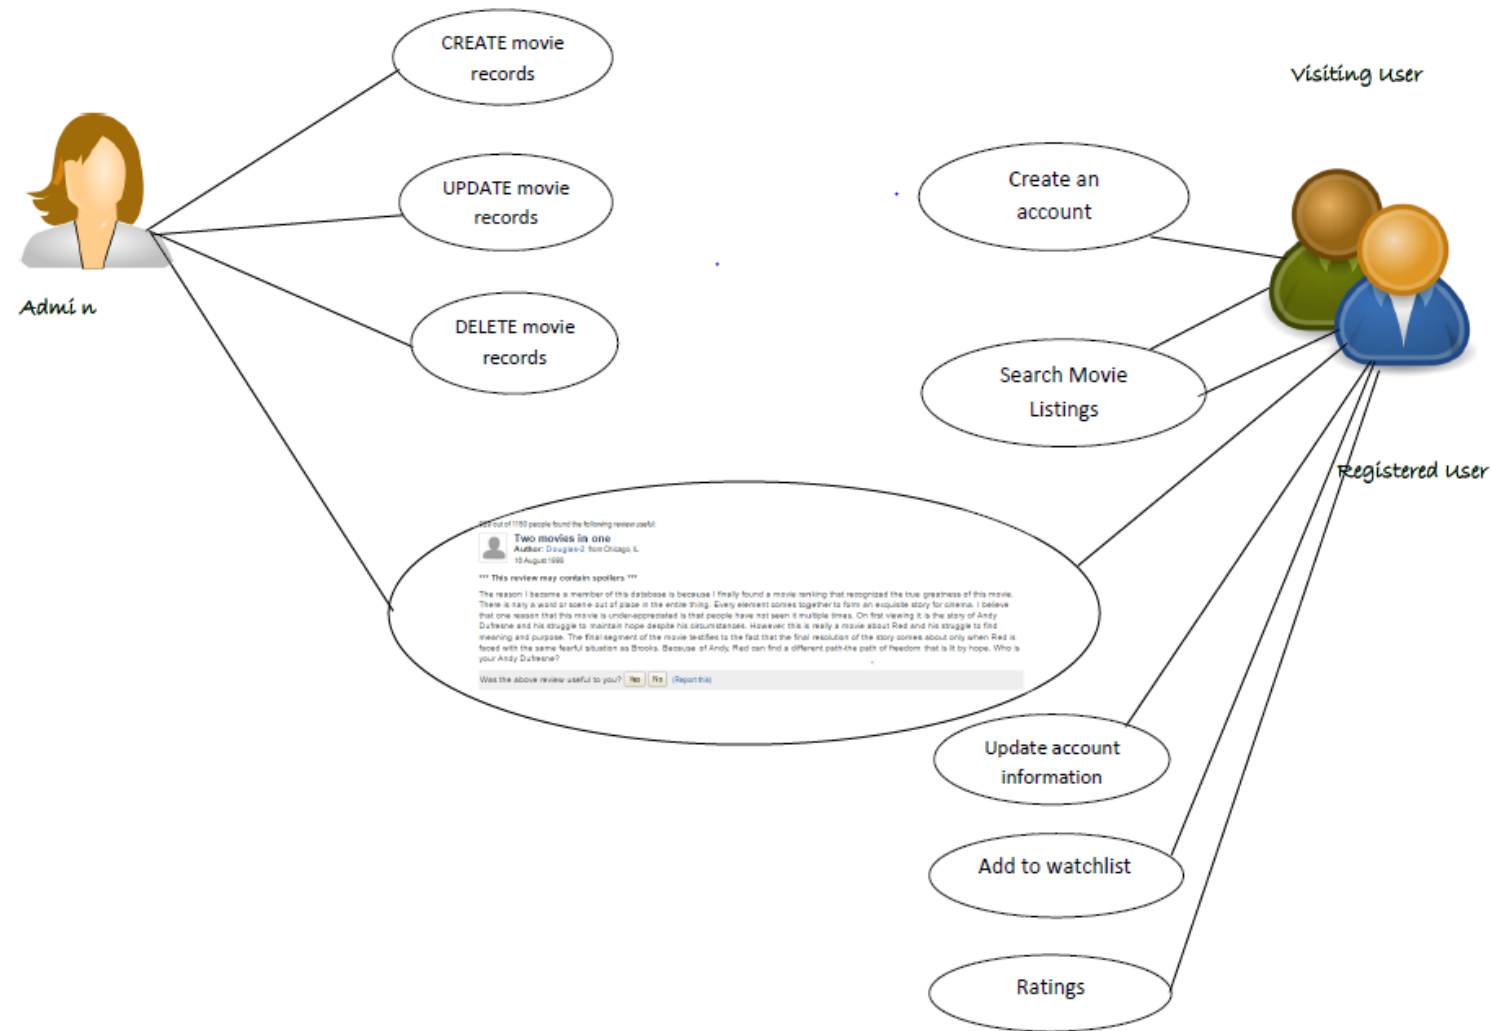

- Users can search for movies, movie actors, movie directors, movie writers, languages, soundmix, and other description of movies.
- Also, they can rate and review movies.

Some of the possible queries for which this database can be used are as under:

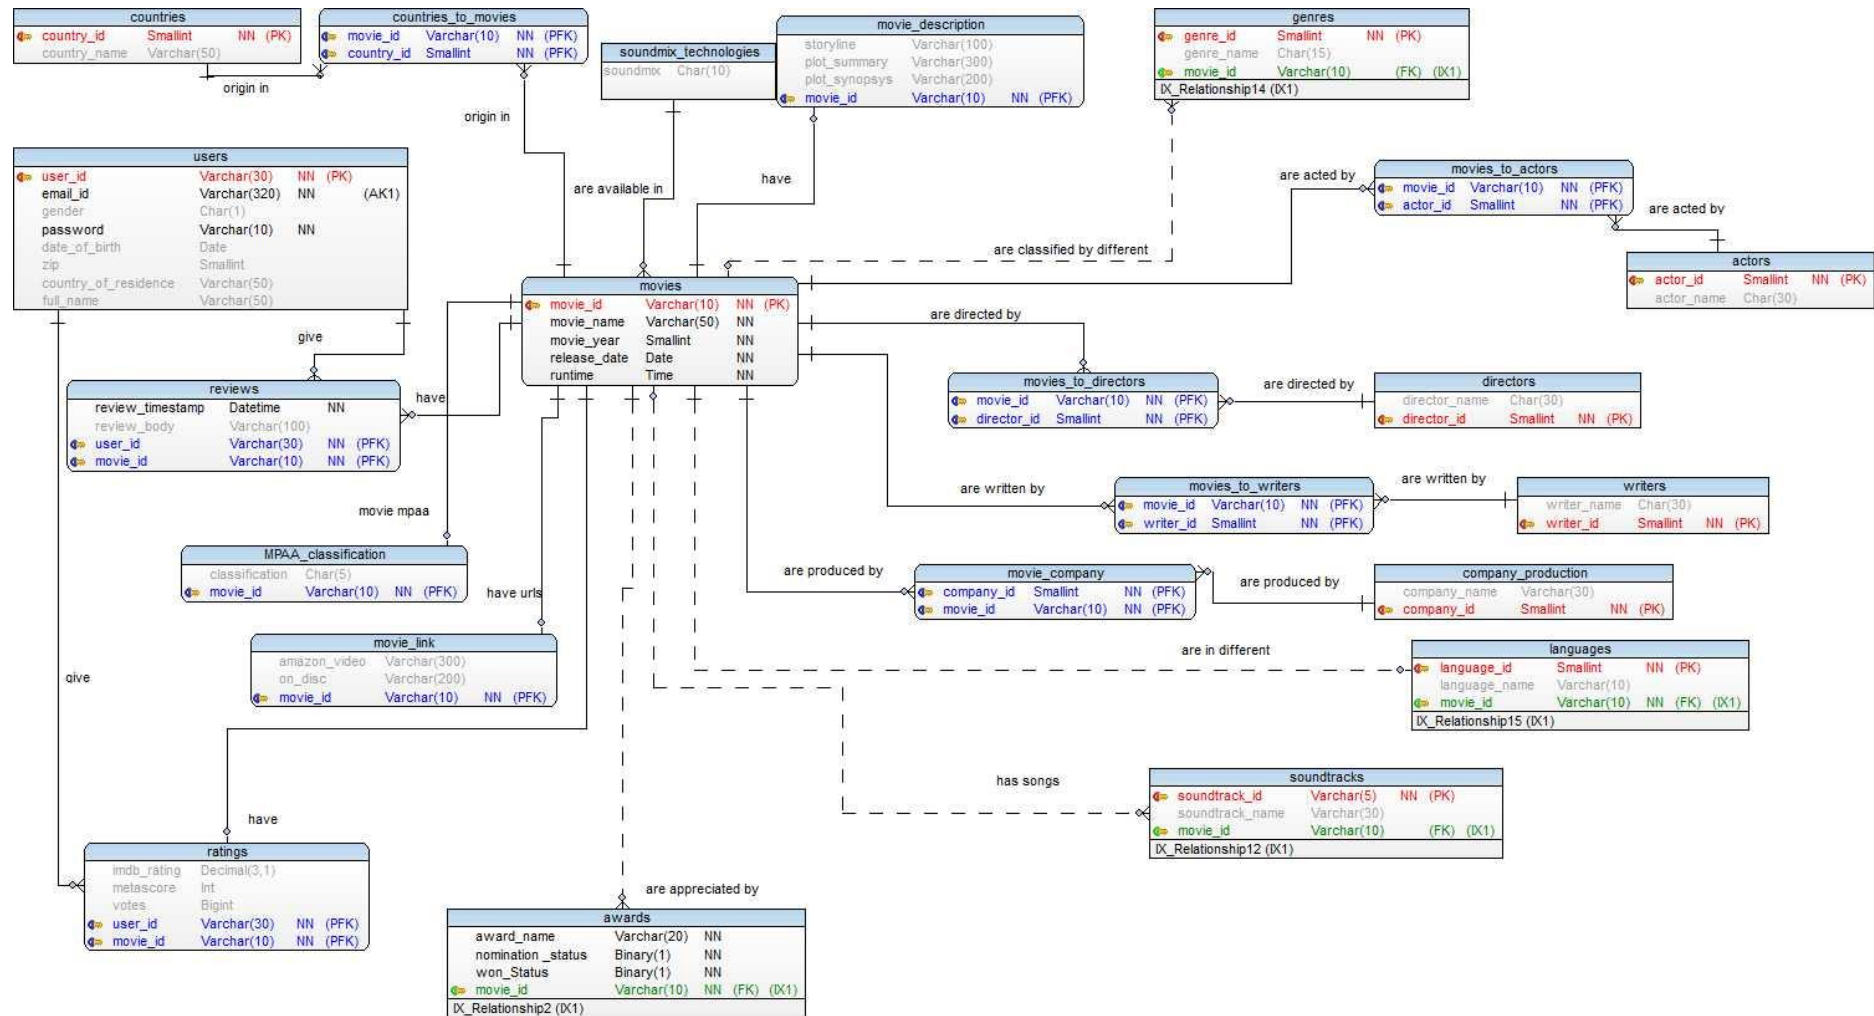

- Knowing actor's/director's/writer's name, a user might want to see the movies that the person is associated with.
- Knowing the movie name a user might want to see out who are the cast and crew associated with.
- A user may want to see the movie description, plot synopsis and summary of a movie by using the movie name.
- A user can rate and/or review a movie.
- A user might want to know director with most movies directed, or actor with number of years in the industry of a writer with number of literary awards won.
- A user may also want to see an award with the movie associated and its nomination and won status.

- A user may want to see a movie by genre and by languages.
- A user might consider knowing finding a movie by a soundtrack in the movie.
- A user can see the language of the movie and see if he/she is interested in watching the movie.
- A movie can possibly be available in online video mode or on disc. A user might be interested in seeing the links of the amazon movie options.
- A user can decide on a movie by looking for MPAA classification of the movie.
- A user can see the release date of a movie and get an idea about in-theatre movie option.

## USE CASE DIAGRAM:

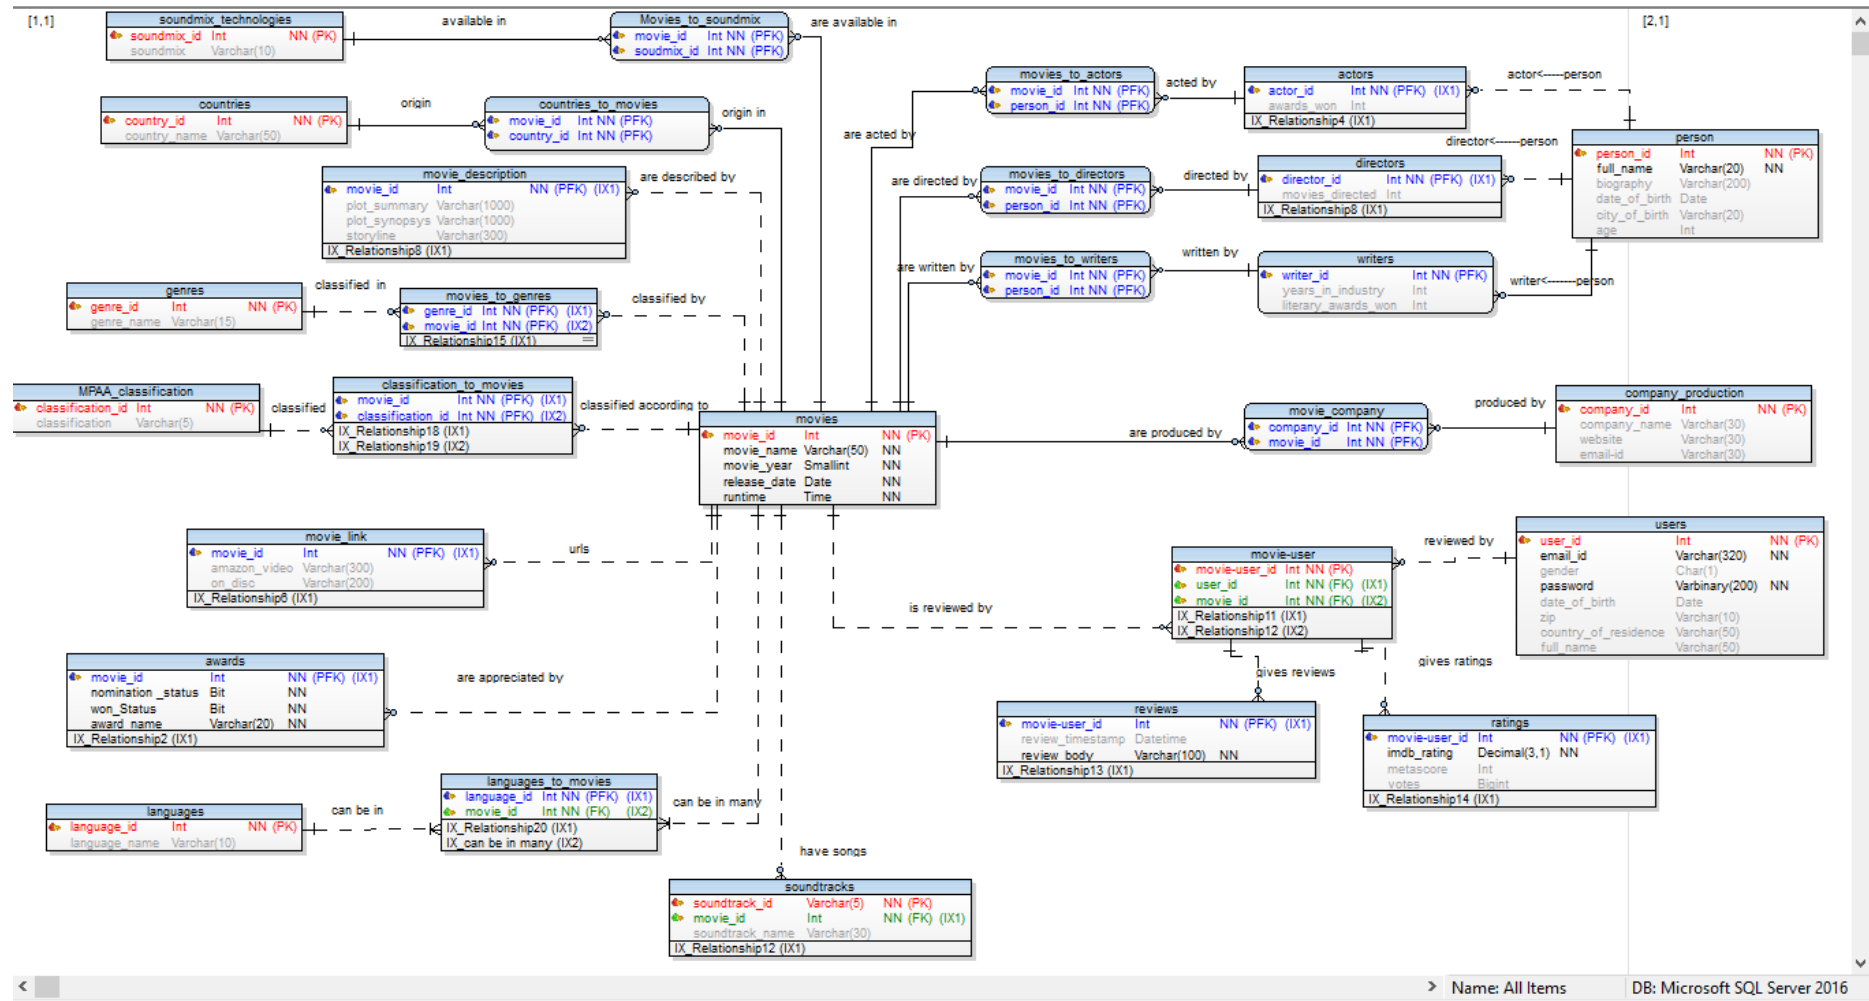

## INITIAL ER Diagram:

## Extended ERD:

Normalised tables and re-created EER diagram to remove transient and functional dependencies. The main aim was to remove any possible redundant data in a table.

### **IMPLEMENTATION STEPS:**

Step1: Generated basic script from Toad for MS-SQL server (table creation queries were alphabetical). Added sys.database auto creation query batch.

Step2: Removed clustering and restriction add errors. Changed the order of queries according to relationships.

Step3: Populated the tables with INSERT and TRANSACTION-COMMIT commands.

Step4: Tested the database with simple queries like joining two tables.

Step5: Created necessary TRIGGERS, VIEWS, STORED PROCEDURES and USER- FUNCTIONS.

## PROCEDURES/TRIGGERS/VIEWS/FUNCTIONS:

1. Procedure: I already had date of birth column in person table and didn't want to put age as a separate column.

So, this procedure computed age column for me.

The screenshot displays the SQL Server Enterprise Manager interface. On the left, the 'Query Editor' window shows a SQL script for creating a stored procedure named 'deriveAge'. The script uses 'ALTER table' to add an 'age' column to the 'person' table, calculated as the difference between the current date and the 'date\_of\_birth' column. Below the script, the 'Results' window shows the output of a query: 'SELECT \* FROM person'. The results are displayed in a table with columns: person\_id, full\_name, biography, date\_of\_birth, city\_of\_birth, and age. The table contains 15 rows of data for various actors and directors. On the right, the 'Server Enterprise Explorer' window shows the database structure, including tables like 'languages\_to\_movies', 'movie\_company', 'movie\_description', 'movie\_link', 'movies', 'movies\_to\_actors', 'movies\_to\_directors', 'movies\_to\_genres', 'Movies\_to\_soundmix', 'movies\_to\_writers', 'movie-user', 'MPAA\_classification', and 'person'. The 'person' table is expanded, showing its columns: 'person\_id' (PK, int, not null), 'full\_name' (varchar(20), not null), 'biography' (varchar(200), null), 'date\_of\_birth' (date, null), 'city\_of\_birth' (varchar(20), null), and 'age' (Computed, int, null).

```
762 go
763
764
765
766 ---procedure to create derived age column---
767 CREATE PROCEDURE deriveAge
768 AS
769 BEGIN
770     ALTER table [dbo].[person] ADD [age] AS (DATEDIFF(year,date_of_birth, getdate()))
771 END
772 GO
773 -----Q: SELECT * FROM person
```

**2.Procedure: I used procedure to delete two records for language 'Mandarin' in languages table. See INSERT section for more details.**

```
CREATE PROCEDURE [dbo].[DeleteDuplicateLanguage_name]
@languages VARCHAR(30),
@language_name VARCHAR(30)
AS
BEGIN
    DECLARE @Temp NVARCHAR(500)
    SET @Temp=N'DELETE duplicates
                FROM (SELECT ROW_NUMBER()
                        OVER (PARTITION BY ' + @languages+ ' ORDER BY ' + @language_name + ') rownumber
                        FROM ' + @languages +') duplicates
                WHERE duplicates.rownumber > 1';

    EXEC(@Temp);
END
GO
```

### 3. TRIGGER: I used the trigger below to update timestamp column to current timestamp.

c

```
862 | --trigger to create review timestamp column--
863 | CREATE TRIGGER review_timestamp
864 | ON [dbo].[reviews]
865 | AFTER INSERT AS
866 | BEGIN
867 |     UPDATE [dbo].[reviews] SET [review_timestamp]=CURRENT_TIMESTAMP
868 |     WHERE [mov-user_id]=(SELECT [mov-user_id] FROM inserted)
869 | END
870 | GO
871
872 | -----Q: SELECT * FROM reviews
873 | --trigger to encrypt password column--
874 | CREATE TRIGGER EncryptUserPassword
875 | ON [dbo].[users]
876 | AFTER INSERT AS
877 | BEGIN
878 |     CREATE MASTER KEY
879 |     ENCRYPTION BY PASSWORD = 'TEst_P@ss';
880
```

5. VIEW: This view was created to avoid rewriting entire queries to join movies and country tables.

6. VIEW: This was similarly created for movies and language tables.

```
792  
793 --view on country and movies----  
794  
795 CREATE VIEW movie_in_country  
796 AS  
797 SELECT m.movie_id, m.movie_name, m.release_date, c.country_name  
798 FROM movies m  
799 JOIN countries_to_movies c2m  
800     ON m.movie_id = c2m.movie_id  
801 JOIN countries c  
802     ON c2m.country_id = c.country_id;  
803 GO  
804 --Q: select * from movie_in_country  
805  
806 --view on language and movies---  
807 CREATE VIEW movie_in_language  
808 AS  
809 SELECT m.movie_id, m.movie_name, m.release_date, l.language_name  
810 FROM movies m  
811 JOIN languages_to_movies l2m  
812     ON m.movie_id = l2m.movie_id  
813 JOIN languages l  
814     ON l2m.language_id = l.language_id;  
815 GO  
816 --Q: select * from movie_in_language
```

DirectorWithMostDirectedMovies	
1	Barry Jenkins

**8.FUNCTION: This function returns writers with most literary awards won:**

```
CREATE FUNCTION [dbo].[GetWriterWithMostMostLiteraryAwardsWon]()
RETURNS VARCHAR(20) AS
BEGIN
    DECLARE @Awards_won int
    SET @Awards_won = (SELECT max(literary_awards_won) FROM writers)

    DECLARE @Person_id2 int
    SET @Person_id2 = (SELECT writer_id FROM writers WHERE literary_awards_won = @Awards_won)

    DECLARE @Writer_name VARCHAR(20)
    SET @Writer_name = (SELECT full_name FROM person WHERE person_id = @Person_id2)

    return @Writer_name
END
```

## DATABASE DIAGRAM:

After, I generated script from Microsoft SQL Server to reorder queries and paste in this document, I created ER diagram from database itself. I compared ERR from toad model to this one and all the relationships were entirely the same.

### --SCRIPT:

```
